Background

The question we asked ourselves after being given laptops when we had settled at AkiraChix was how we were going to store our laptops ,and we saw this as an existing problem since we could not access our drawers at the same time

So we decided to come up with this problem after we observed that during laptop storage there is

- Overcrowding
- Scrambling
- And confusion among student which lead to time wastage as they wait for each other to store their laptops since they cant access their drawers at the same time

Problem Statement

.How might we improve time management during laptops storage for the student at AkiraChix

Research objectives

The question we are trying to answer is to find out the following:

1. Where they keep their laptop
2. How they are storing their laptop

3. Why is scrambling and overcrowding in existence during laptop storage and if it is caused by storage space.

Methodology

The research methods that we will use include:

Interview since it will provide deeper understanding of how the problem came into existence and also to acquire quantitative analysis through assigning numerical value to participants' responses.

Observation so that we can see the users behaviour and attitude when storing their laptops.

Research participants

The school administrations will help us in recruiting the students hence for the qualitative analysis we shall have 30 participants and for the the quantitative analysis we shall have 39 participants

Logistics

We will use pens ,papers ,phones for recording for future reference and laptops as our equipment to collect the data required.

Location

Akirachix

Script

How we shall introduce ourselves is that we will greet the people and explain our problem statement to them so that they can have a clear understanding of what it entails and what the research is all about then we'll ask them for their consent if yes

we proceed with asking them ;

1.How they store their laptops

2.Is the procedure they are using to store their laptops good enough for them or they feel it is bad way of storing their laptops

3.Do they take a lot of time in storing the laptops

Timeline

During the interview the answering of questionnaire will require 20 minutes since it is short and precise hence it will not have difficulties for our participants to figure out what the questions entail while for the qualitative analysis we shall require 35minutes since it requires a lot of information through interaction where they shall be able to answer the question why and how.

Analysis and Synthesis

The data collected from the participants will be analysed for future reference and the different results from participants will be compared so that we receive different opinions from the participant.
